USE CASE DIAGRAM FOR ATM WITHDRAWAL SYSTEM

Aim:

To design and analyze a Use Case Diagram for the ATM Withdrawal System using UML concepts.

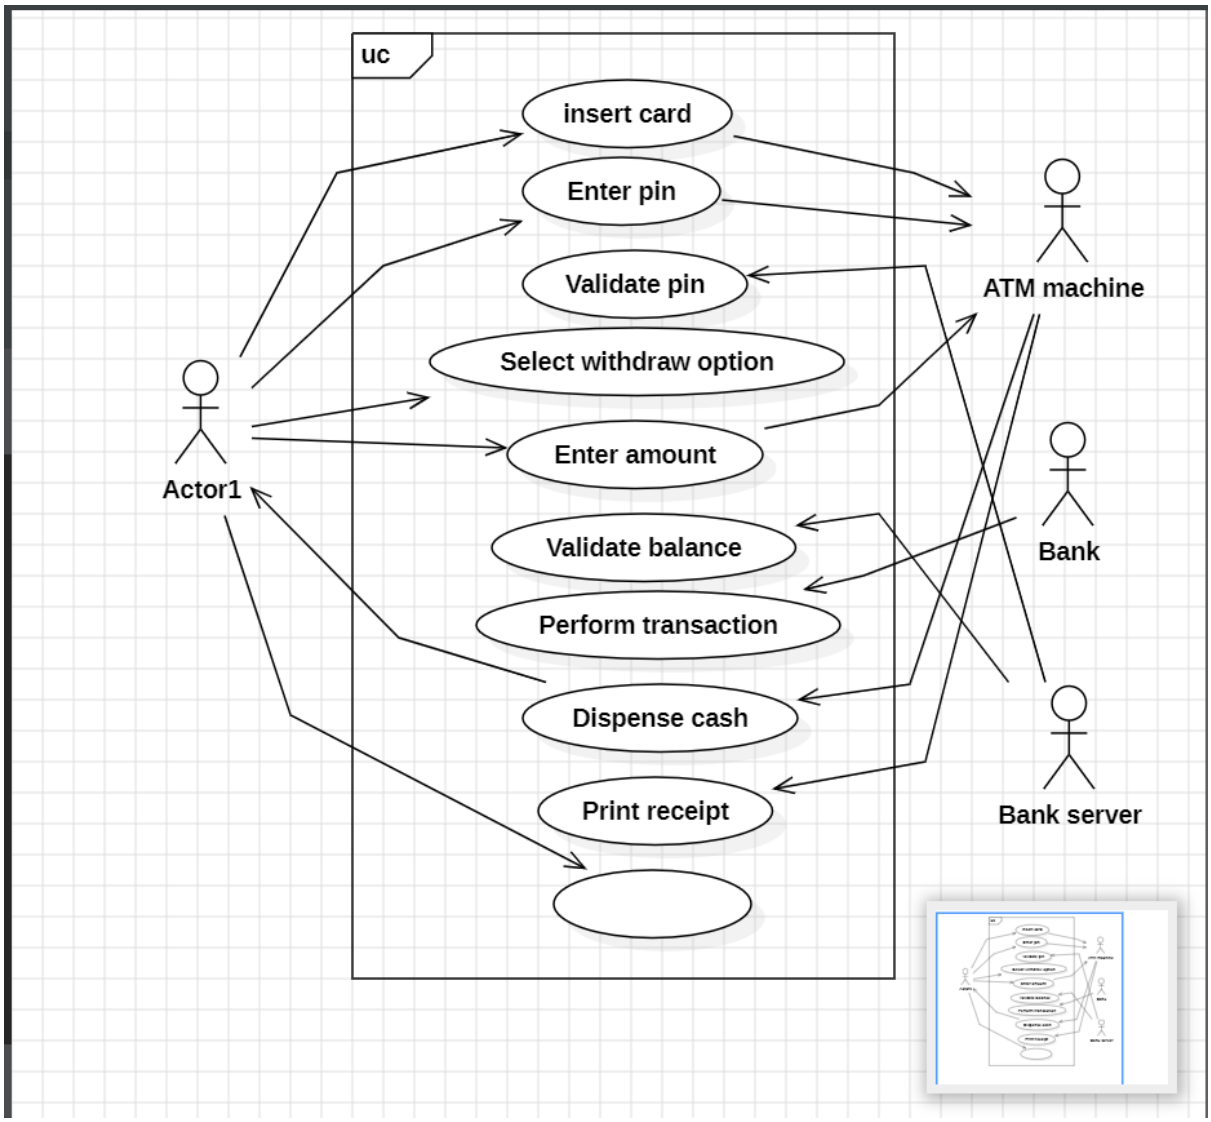
Problem Statement:

To model the interaction between the user and the ATM system during a cash withdrawal transaction and represent the communication between the ATM system and the bank server.

System Description:

The ATM Withdrawal System allows a customer to withdraw money from their bank account.The user inserts the ATM card, enters the PIN, selects the withdrawal option, enters the amount, and receives cash.The system verifies the user credentials with the bank server before performing the transaction. If authentication is successful and sufficient balance is available, the system dispenses cash and prints a receipt.

Usecase diagram:



Actors Identified:

1. User – Initiates and performs ATM transactions.
2. Bank Server – Validates PIN and checks account balance.
3. Bank – Maintains customer account information and transaction records.

System Boundary:

The system boundary is represented as "ATM System", which contains all the use cases involved in the withdrawal process.

Use Cases Identified:

1. Insert Card
2. Enter PIN
3. Validate PIN
4. Select Withdraw Option
5. Enter Amount
6. Check Balance
7. Perform Transaction
8. Dispense Cash
9. Print Receipt
10. Eject Card

Relationships:

Withdraw Cash includes:

- Validate PIN
- Check Balance
- Perform Transaction
- Dispense Cash

Result:

Thus, the Use Case Diagram for ATM Withdrawal System was successfully designed using UML notation.
